

Question 1. [7 MARKS]

Beside each code fragment in the table below, write what is printed when the code is executed. If the code would cause an error, simply write ERROR. If the code runs but does not print anything, write the word NOTHING.

Code	Output, ERROR, or NOTHING
<pre>s = "I like reading" print(s[0])</pre>	I
<pre>s = "I like reading" print(s[2:4])</pre>	li
<pre>s1 = "dog" s2 = "cat" print(s1 + s2)</pre>	dogcat
<pre>s1 = "dog" s2 = "cat" print(s1 == s2)</pre>	False
<pre>s1 = "dog" s2 = "cat" print(s1 * s2)</pre>	ERROR
<pre>words = ["rat", "mouse", "vole", "newt"] n = len(words) print(n)</pre>	4
<pre>words = [] s1 = "dog" s2 = "cat" words.append(s1) words.append(s2) print(words)</pre>	['dog', 'cat']

Question 2. [2 MARKS]

Complete the conditional statements below by filling in the blank boxes with either a simple conditional expression or an appropriate string that describes the result of the condition. Do not modify or add to code outside of the boxes. Assume n has been given a positive or negative integer value.

```
if n ≥ 10:
    if n > 70:
        print("n is greater than 70")
    elif n == 70:
        print("n is 70")
    else:
        print("n is between 11 and 69 inclusive")
else:
    print("n is less than 10")
```

```
if n > 10:
    if :
        print("n is greater than 70")
    elif :
        print("n is 70")
    else:
        print("n is between  inclusive")
else:
    print("n is )
```

Question 3. [4 MARKS]

The variable `highs` contains a list of temperatures for the week. Your task is to write a snippet of Python code that will print the number of temperatures in `highs` that are greater than 20.

Below is an example value for `highs`. If this value was used, your code should print 3. Your code should still work correctly if we change the value of `highs`.

```
highs = [17, 21, 19, 18, 22, 30, 18]
```

```
count = 0
for temp in highs:
    if temp < 20:
        count += 1
```

```
print(count)
```
